AMENDMENTS TO THE CLAIMS

1. (Currently Amended): A method of characterizing the biological activity of a candidate compound comprising:

exposing one or more cells <u>comprising at least one voltage regulated ion channel</u> to said compound;

repetitively exposing said one or more cells to a series of two or more electric fields so as to effect a change in transmembrane potential of said one or more cells without using a patch clamp, wherein said transmembrane potential changes predominantly in a single direction away from a starting transmembrane potential over the course of said series of electric fields due to a continuing and additive accumulation of charge in said cell over the course of said series of electric fields; and

monitoring, without using a patch clamp, changes in the transmembrane potential of said one or more cells to characterize the biological activity of said compound.

- 2. (Original) The method of Claim 1, wherein said monitoring comprises detecting fluorescence emission from an area of observation containing said one or more cells.
 - 3. (Original) The method of Claim 1, wherein said electric fields are biphasic.
- 4. (Original) The method of Claim 3, additionally comprising limiting spatial variation in electric field intensity so as to minimize irreversible cell electroporation.
- 5. (Original) The method of Claim 1, wherein one or more electrical fields cause an ion channel of interest to cycle between different voltage dependent states.
- 6. (Original) The method of Claim 5, wherein said one or more electrical fields cause an ion channel of interest to open.
- 7. (Original) The method of Claim 5, wherein said one or more electrical fields cause an ion channel of interest to be released from inactivation.
- 8. (Original) The method of Claim 1, wherein said one or more cells comprise a voltage sensor selected from the group consisting of a FRET based voltage sensor, an electrochromic transmembrane potential dye, a transmembrane potential redistribution dye, an ion sensitive fluorescent or luminescent molecule and a radioactive ion.

9. (Canceled)

:

10. (Original) The method of Claim 9, wherein said voltage regulated ion channel is selected from the group consisting of a potassium channel, a calcium channel, a chloride channel and a sodium channel.

- 11. (Original) The method of Claim 1, wherein said electric field exhibits limited spatial variation in intensity in the area of observation of less than about 25% from a mean intensity in that area.
- 12. (Original) The method of Claim 11, wherein said one or more electrical fields varies over an area of observation by no more than about 15 % from the mean electrical field at any one time.
- 13. (Original) The method of Claim 12, wherein said one or more electrical fields varies over an area of observation by no more than about 5 % from the mean electrical field at any one time.
- 14. (Original) The method of Claim 1, wherein said one or more electrical fields comprises stimulation with either a square wave-form, a sinusoidal wave-form or a saw tooth wave-form.
- 15. (Original) The method of Claim 1, wherein said one or more electrical fields have an amplitude within the range of about 10 V/cm to about 100 V/cm.
- 16. (Original) The method of Claim 15, wherein said one or more electrical fields have an amplitude within the range of about 20 V/cm to about 80 V/cm.
- 17. (Original) The method of Claim 1, wherein said one or more electrical fields are repeated at a frequency of stimulation that is greater than or equal to the reciprocal of the transmembrane time constant of said one or more cells.
- 18. (Original) The method of Claim 1, wherein said one or more electrical fields are repeated at a frequency of stimulation within the range of zero to 1kHz.
- 19. (Original) The method of Claim 1, wherein said one or more electrical fields have a pulse duration within the range of about 100 microseconds to about 20 milliseconds.
- 20. (Original) The method of Claim 1, wherein said transmembrane potential is developed across the plasma membrane of said one or more cells.

Appl. No. : 09/804,457 Filed : March 12, 2001

21. (Currently Amended) A method of assaying the biochemical activity of a compound against a target voltage regulated ion channel comprising:

selecting a cell line having a normal resting transmembrane potential corresponding to a selected voltage dependent state of said target ion channel;

expressing said target <u>voltage regulated</u> ion channel in a population of cells of said selected cell line;

exposing said population of cells to said compound;

repetitively exposing said population of cells to a series of two or more electric fields so as to effect a change in transmembrane potential of said population of cells, wherein said transmembrane potential changes predominantly in one direction away from a starting transmembrane potential over the course of said series of electric fields due to a continuing and additive accumulation of charge in said cell over the course of said series of electric fields; and

monitoring changes in the transmembrane potential of said population of cells to characterize the biochemical activity of said compound.

- 22. (Currently Amended) The method of Claim 21, wherein said target voltage regulated ion channel is endogenously expressed in the cell line.
- 23. (Original) The method of Claim 21, wherein said cell line is transfected with nucleic acid encoding said target <u>voltage regulated</u> ion channel.
- 24. (Currently Amended) The method of Claim 23, wherein said cell line expresses substantially only said target <u>voltage regulated</u> ion channel.
- 25. (Original) The method of Claim 24, wherein said cell line is selected from the group consisting of CHL, LTK(-), and CHO-K1.
- 26. (Currently Amended) The method of Claim 21 wherein said target <u>voltage</u> regulated ion channel is a sodium channel, and wherein said population of cells is selected from the group consisting of CHL cells, LTK(-) cells, and CHO-K1 cells.
- 27. (Currently Amended) The method of Claim 21 wherein said target <u>voltage</u> regulated ion channel is a sodium channel, and wherein said population of cells is selected from the group consisting of HEK-293 cells, RBL cells, F11 cells, and HL5 cells.

Appl. No. : 09/804,457 Filed : March 12, 2001

28. (Currently Amended) The method of Claim 21 wherein said target voltage regulated ion channel is a potassium channel, and wherein said population of cells is selected from the group consisting of CHL cells, LTK(-) cells, and CHO-K1 cells.

29. (Currently Amended) The method of Claim 21 wherein said target <u>voltage</u> regulated ion channel is a calcium channel, and wherein said population of cells is selected from the group consisting of CHL cells, LTK(-) cells, and CHO-K1 cells.

30-48 Cancelled

- 49. (Previously Presented) The method of Claim 1, additionally comprising using said electric fields to maintain said transmembrane potential within a predefined range.
- 50. (Previously Presented) The method of Claim 21, additionally comprising using said electric fields to maintain said transmembrane potential within a predefined range.
